

WorkStream

Inspection workflow management software solution for digitising operations

WorkStream is a powerful software platform designed to organise, automate, and optimise production workflows, helping businesses maximise efficiency, consistency, and quality across inspection and testing processes.

Maximise Time

A centralised, automated workflow system that streamlines operations by improving visibility, consistency, traceability, and access to information while reducing manual effort, errors, and administrative burden across every site and stage of the process.

Drive Growth with Data

Turn operational data into actionable insight that strengthens decision-making, improves forecasting and optimisation, enhances customer value, and drives continuous improvement through clearer visibility of performance, costs, and opportunities across the entire business.

Reduce Risk

A secure, centralised digital system that preserves organisational knowledge, strengthens compliance, ensures full traceability, reduces reliance on individuals, and improves consistency, quality, and resilience through controlled, standardised, and well-governed workflows.

Why WorkStream?

By replacing traditional paper-based systems with intelligent digital workflows, WorkStream enables organisations to map processes, reduce bottlenecks, standardise procedures, and monitor real-time operational data. Its integrated digital tools improve traceability, streamline collaboration, and provide greater visibility across shop floor operations.

Designed for secure on-premises deployment, WorkStream ensures maximum data protection and compliance. Users access the platform entirely through a web browser, eliminating the need for client-side installations and reducing the burden on IT departments.

With clear operational insight and continuous performance monitoring, WorkStream empowers organisations to improve stakeholder communication, drive smarter decision-making, and support continuous process improvement across the business.

Overview of Key Features

■ Process Mapping & Design

Create intelligent digital workflows that define, standardise, and visualise the entire production lifecycle, including sequential, conditional and parallel operational processes.

■ Workflow Automation

Automate repetitive tasks, alerts, approvals, and next-step actions to reduce manual errors, increase process consistency, and improve operational efficiency.

■ Real-Time Monitoring & Analytics

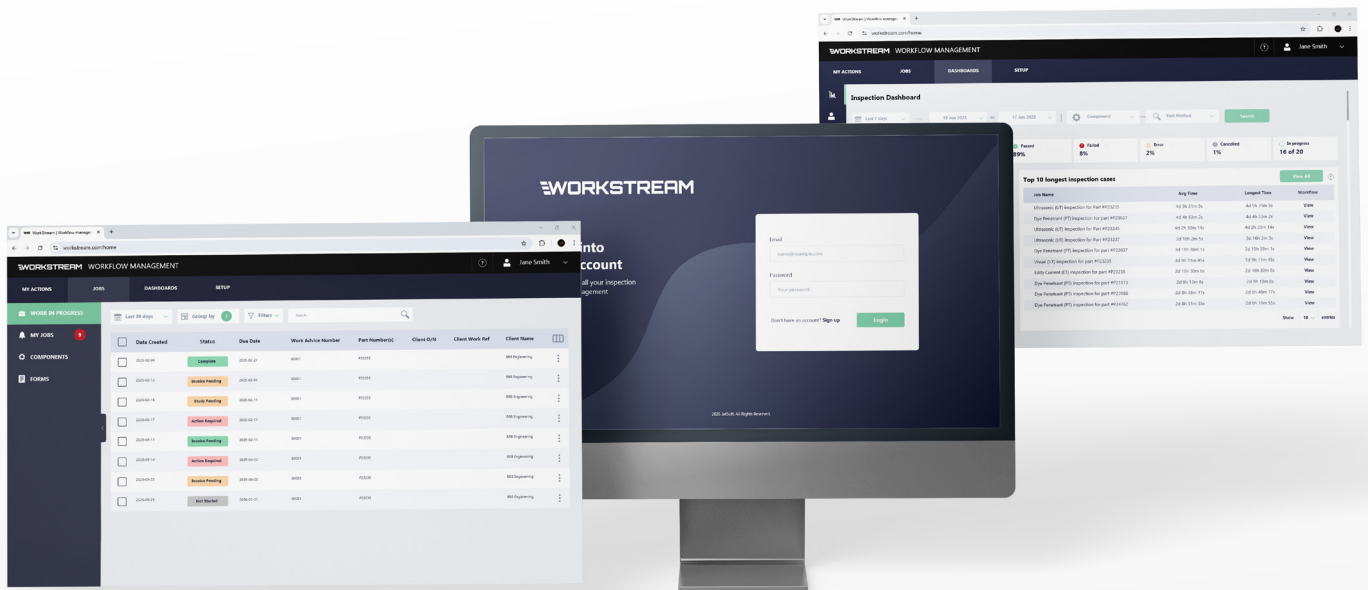

Track KPIs, inspection durations, and operational activity in real time through interactive dashboards that help identify bottlenecks and support data-driven decision-making on the shop floor.

■ System Integration

Seamlessly connect workflows, machinery, and operational systems into a single integrated ecosystem that improves efficiency, enhances visibility, and streamlines communication across the organisation.

■ Centralised Data Integration

Consolidate inspection and operational data into one secure, centralised database with an intuitive interface that improves traceability, reporting, and accessibility.
